

CLAIMS

1. Vertical fencing comprising a pair of rails and a plurality of fence members attached thereto, the fence members being pivotable relative to the rails, at least one of the rails having a recess means, in which the fence members are tubular, and in which each fence member carries a resiliently-biassed projection which is engageable with the recess means.
2. Vertical fencing according to claim 1 in which the fence member has a longitudinal axis, and in which the projection engages the recess means to limit movement of the fence member parallel to the longitudinal axis.
3. Vertical fencing according to claim 1 in which the fence member has a longitudinal axis, and in which the projection engages the recess means to limit rotation of the fence member about the longitudinal axis.
4. Vertical fencing according to claim 1 in which at least one of the rails comprises a channel section.
5. Vertical fencing according to claim 4 in which the channel section includes an inturned part, and in which the recess means is provided by a notch in the inturned part.
6. Vertical fencing according to claim 4 in which the channel section includes an inturned part, and in which the recess means is provided by a hole in the inturned part.
7. Vertical fencing according to claim 1 including a spring clip, and in which the resiliently-biassed projection is provided by a part of the spring clip.

8. Vertical fencing according to claim 7 in which the spring clip is located within the fence member.
9. Vertical fencing according to claim 1 in which fence members and rails lie substantially in a plane, and in which the projection has a longitudinal axis, the axis being substantially perpendicular to the plane.
10. Vertical fencing according to claim 9 in which the fence member pivots relative to said at least one of the rails about the longitudinal axis of the projection.
11. Vertical fencing according to claim 1 in which one or both of the rails has a further recess means and in which the fence members each carry a fixed peg, the recess means of one of the rails engaging the projection and the further recess means of the other rail engaging the fixed peg.
12. Vertical fencing according to claim 11 in which the further recess means comprises a notch and an extension thereof, the extension being provided to permit rotation of the fence member so that the fixed peg can engage the notch.
